

2500 Automatic Tank Gauge Conduit Connection Kit

“Reduce the time and effort needed to remove a gaugehead from the tank side and perform routine maintenance in your workshop.”

Simplify Maintenance

Do your engineers find it difficult to remove a gaugehead from a tape conduit that is painted or rusted tight? Sometimes, even with a standard union fixture fitted, a large pipe wrench and a lot of muscle will not free the gaugehead. At that point, your engineers either perform the required maintenance at the tank side or resort to cutting and re-tapping the conduit to remove and re-fit the gaugehead.

2500 ATG Conduit Connection Kit

The conduit connection kit is a cam locking coupling used for quickly attaching/detaching a 2500 ATG gaugehead from the tape conduit. Your engineers can do this in three easy steps without using hand tools, thereby allowing them to perform maintenance in a workshop, rather than in the field.

- Step one, the female coupler threads on to the conduit line that contains the perforated tape. The coupler includes 2 locking handles and a compression o-ring.
- Step two, the male adapter threads into the top (or bottom) of the 2500 ATG gaugehead.
- Step three, the cam is “pulled” into the coupler via the top groove and seals against the o-ring.
- Once fitted, removing and refitting the gaugehead is as easy as one, two, three!

Contact Us

The kit provides leak proof connections for petroleum liquids, vapors and gases. It is supplied as standard with all new 2500 ATG orders and is also available as a spare part. Make a single call to our team today to save time and effort when performing routine maintenance at your facility.
