

Product Movement Tracking

Application to Monitor Product Transfers Across the Tank Farm

Easy-to-Use System for Managing Transfer Setup, Modifications and Closeout

The system can automatically start and stop the collection of movement data for multiple movements based on plant status, such as a valve opening, pump starting, scheduled date and time, or from imported bulk shipment schedules. Automated daily closeout times can be configured for any time during the day. Alarms can be configured at critical set points to automatically alert operators when there is a potential issue. Using custom interfaces, product movement information can also be integrated to deliver real-time data to other operational systems, such as customer orders, logistics, planning and yield accounting.

Movement data is also available for each tank on the tank detail screen.

Reports and Tickets

Standard reports and tickets are supplied with the movement system or system administrators can create custom reports and tickets using third-party reporting tools. Reports and tickets can also be formatted based on business needs. Reports can be previewed by the operator and then printed or scheduled to print automatically, such as when a movement ends or on the daily closeout schedule.

Movements and Transfers

The movement summary provides the operator with an easy-to-read tabular display of current product movements and a means to create and control new movements. Multiple movements can be configured and edited in-line with operations, without shutting down the system. The data can be modified or corrected after completion using archived data collected by the movement system, thereby ensuring accurate start/stop data is used. Operators can easily expand or contract each movement to display/hide nodes and details for each individual movement or open multiple movement history windows and visually compare movement data from different days.
